

1. Attempt ALL

- (a) Write a program to determine the discount a customer gets at a shop. The program should take the amount (in rupees) that the customer spends and print the discount the customer will receive.

• Discount rules:

- If the amount is less than 50, the discount is 0%.
- If the amount is between 50 and 100 (inclusive), the discount is 10%.
- If the amount is between 101 and 200 (inclusive), the discount is 20%.
- If the amount is greater than 200, the discount is 30%.

(5)

- (b) Write a program to read two distinct integers from user and print the larger number using ternary operator.

(3)

- (c) Write a program that asks the user for a number N and then prints a simple "count-down pattern" from N down to 1, but all on one line separated by dashes.

- Input : $n = 5$
- Output : 5-4-3-2-1

Note : If your roll number is odd solve the above using for loop, else make use of while loop.

(5)

- (d) Write a program that asks the user for a number N and then prints all numbers from 1 to N , classifying each number as:

- Even and multiple of 4
- Even but not a multiple of 4
- Odd

Example:

Input = 5

Output:

- 1 → Odd
- 2 → Even but not a multiple of 4
- 3 → Odd
- 4 → Even and multiple of 4
- 5 → Odd

Note : If your roll number is even solve the above using for loop, else make use of while loop.

(7)

— Why do Linux users never get lost? Because they always know where the root is. —
